

By checking on the WWF Footprint calculator¹ carbon footprint was 91% which was broken down as the following figure

I also did another check using Finnish Environmental Inst. Tool² and got the result as bellow

In general, the carbon footprint generated by me was lower than the UK average levels but a bit larger than the world average levels. Comparing to Finns, the amount of CO₂ generated by me was also lower especially in Housing sector.

It is understandable because as a student, I don't have many appliances in my apartment. The room is also very small and I usually turn off all of my devices when I'm not using them. With that strategy, I can save a lot of energy, resulting in less carbon footprint. In the mobility and travel sectors, the carbon footprint caused by me was also small because I walk to school every day and sometimes take the bus for the long distance. For foods and basic stuff, it's not so different between me and local other people and I think it would also be similar from all around Europe because we share the similar living standards. In the waste sector, I don't have much carbon footprint because I also try to consume what I've bought and recycle as much as I can.

Overall, I think my living style is considered as sustainable living.
