

SUSTAINABILITY SCIENCE EDUCATION

This is a project launched by Nobel Laureate Dr. Lee Hartwell. The project is based in Arizona State University's Biodesign Institute and its aim is to empower K-8th grade educators with an understanding of how science, technology, design, and effective governance can create a sustainable society, and to inspire educators with the ability to translate these concepts. To create a sustainable future, children should know learn how to live sustainably and the best way to achieve this is by been taught in school from an early age. This is where training of teachers on sustainability comes in, so they can impart the knowledge on their students. When teachers' knowledge, skills and attitude towards sustainability is improved, it is only expected that the students will have a positive attitude towards sustainability. Imparting this knowledge on students and also from parents to their wards gives the future generation the required tools, knowledge and skills to live sustainably.
